

MYKOLA MAKHOVYK

Senior QA Analyst

heaxyle@gmail.com | [Linkedin](#) | Verona, KY (open to relocation and remote)

Authorized to work in the US, no sponsorship required

PROFILE

Senior QA Analyst with six years of experience testing large-scale, live consumer products at Epic Games (Fortnite) and Ubisoft. Owns features end to end, from test planning and coverage through production release and post-release monitoring, with hands-on experience in purchase flows, paid content entitlements, and user progression systems. Shipped every owned feature without a critical or blocking issue. Led a test sub-team, onboarded roughly 24 new testers, and coordinated external QA teams.

SKILLS

- **Testing:** Functional, Regression, Smoke, Integration, Compatibility, UI/UX, Localization, Performance, User Acceptance Testing (UAT), Production release and hotfix verification
- **Documentation & validation:** Test plans, test cases, test evidence, and daily/weekly status reporting; documentation-driven, requirements-based testing suited to regulated validation work
- **Domain experience:** Monetization and purchase flows (virtual currency spending, paid pass purchases), paid content entitlements, age-rating content restrictions, in-game economy transactions, user progression and rewards, configuration and content data validation, live-service release cycles
- **Platforms:** Desktop (Windows), mobile (Android, iOS), console (PlayStation, Xbox, Nintendo Switch, on dev kits), cloud streaming
- **Tools:** JIRA, TestRail, QMetry, Confluence, Jenkins, Perforce (P4V)
- **Automation:** Python (PyAutoGUI) UI verification script; record/playback scenario automation run in Jenkins CI
- **Leadership & Process:** Agile/Scrum, test planning, sub-team leadership, onboarding and mentoring, external QA team coordination, QA status and risk reporting

WORK EXPERIENCE

Senior QA Tester | Epic Games, Cary, NC | Fortnite

Sep 2023 – Aug 2025

- Owned QA for 5–8 features per release season across Fortnite’s player progression and monetization systems (quests, rewards, and the paid seasonal Battle Pass), including licensed brand partnerships such as Pirates of the Caribbean and Teenage Mutant Ninja Turtles.
- Tested Battle Pass purchase flows end to end (virtual currency spending, purchase completion, ownership verification) and age-rating restrictions on its cosmetic content for younger audiences.
- Built test plans and coverage from scratch, verified each feature integrated cleanly with existing systems and shared data, and flagged quality risks and coverage changes to design and production.
- Shipped every owned feature without a critical or blocking issue, catching pre-release defects that blocked user progression and prevented players from accessing licensed partner content.
- Validated configuration and content data in the internal content editor, repeatedly catching data carried over between releases that still referenced outdated, no-longer-existing items.
- Verified fixes in a pre-production staging environment before release, tested new features in isolated test environments, and adjusted live configuration values to create targeted test conditions.
- Briefed external QA teams on expected behavior each release cycle, reducing misfiled defects and clarification requests to developers and designers.
- Monitored owned features during production releases and live events, confirming clean deployment and standing by to verify hotfixes.

Ubisoft | Anno 1800, strategy title on PC and console

Jun 2019 – May 2023

Development QA, Ubisoft Mainz, Germany

May 2022 – May 2023

Transferred to Mainz to continue on the same product through its console release (PS5, Xbox Series X|S).

- Recorded and configured automated validation scenarios for core gameplay flows, such as spending in-game currency on buildings and validating the result, stored in Perforce and run in Jenkins CI; monitored daily pass/fail results, reducing manual smoke and regression testing.
- Continuously updated test suites and wrote new test cases based on test results and coverage gaps, keeping coverage current instead of spending effort on outdated cases.

- Tested assigned areas hands-on, escalating critical and blocking issues ahead of release milestones.
- Tracked feature progress in development meetings, relayed changes to external QA teams, and analyzed their results to keep their coverage aligned with current builds.
- Built a Python (PyAutoGUI) script verifying that settings labels and screen resolution changes rendered correctly.

Game Tester (QA/QC), Ubisoft Kyiv, Ukraine

Jun 2019 – May 2022

- Tested the PC version across all areas for three years; caught a revenue-impacting entitlement defect in multiplayer sessions that gave every participant paid add-on content only one user had purchased, before release.
- Built and maintained test plans and test cases, and helped junior and mid-level testers cover their assigned areas.
- Grew from the original four-person PC squad into leading the PS5 sub-team when console development began; onboarded and trained roughly 24 new testers, ramping them up fast enough to keep pace with the project.
- Assigned daily tasks with the team lead, led internal playtest sessions, and reported QA status daily and weekly.

INDEPENDENT PROJECTS | AUG 2025 – PRESENT

Drake Arena – real-time web app driven by live Twitch chat events, English/Ukrainian | [GitHub](#) | [Live demo](#)

- Directed the AI-assisted build and ran it like a production feature: reviewed each build, logging bugs and rule changes (13 in one review round), and requested test coverage for every change.
- That coverage now runs in CI on every pull request: seeded simulations (~24,000 runs per build) behind a pass/fail gate, mutation testing that proves the suite catches injected bugs, and Playwright UI and layout checks in both languages.

Dressmaker (commercial PC game, Steam) – Ukrainian localization

- Directed an AI-assisted translation of ~5,800 strings (UI, tutorial, items, dialogue) with a terminology glossary and grammatical-gender rules, validated placeholders and rich-text tags, tracked down strings stored outside the localization tables, and ran in-game LQA on two PCs with documented known issues.

QA knowledge assistant – local retrieval (RAG) tool

- Directed the AI-assisted build of a tool that answers questions from test plans, specs, and past bug reports, citing the source file on every answer (LangChain, ChromaDB, Ollama).

CERTIFICATIONS

ISTQB Certified Tester, Foundation Level | ASTQB Test Management

EDUCATION

Specialist in Finance and Credit, Academy of Labor, Social Relations and Tourism, 2014
